First published in 1963, *Advances in Parasitology* contains comprehensive and up-to-date reviews in all areas of interest in contemporary parasitology. *Advances in Parasitology* includes medical studies on parasites of major influence, such as *Plasmodium falciparum* and *Trypanosomes*. The series also contains reviews of more traditional areas, such as zoology, taxonomy, and life history, which shape current thinking and applications. With an impact factor of 3.9 the series ranks second in the ISI Parasitology subject category.

Cyprinids rank as one of the most commercially important groups of freshwater fishes and are exploited for many purposes; as a human food source, especially in Europe and Asia; as sport fish; and as ornamental fish for ponds and aquaria. Certain species are also cultured as bait fish and several of the small cyprinids such as the zebra fish have become internationally accepted laboratory models for toxicology testing and molecular research. A thorough understanding of cyprinid health and diseases is fundamental to the successful management and exploitation of these fishes for freshwater fisheries, pisciculture and ornamental productions. This practical guide to disease diagnosis, prevention and control includes numerous colour plates and covers a comprehensive array of diseases - infectious and non-infectious - of cultivated and wild cyprinids.

Toxoplasmosis, a world-wide infection of animals and humans, may produce severe congenital abnormalities in pregnancy, while among the immunocompromised (malignancies, organ transplant, or human immunodeficiency virus infection), death may result. Toxoplasmosis is likely to become more common, and those who manage high-risk patients must be aware of the infection, and the latest techniques for minimizing its serious complications. Women need testing consistent with medical defence advice as well as advice on avoiding infection. This comprehensive volume contains chapters on the history of toxoplasmosis, its clinical features and life cycle, diagnosis management, prevention, and possible future developments. Animal infection, with its important economic and human implications, is considered separately. The appendix contains a detailed treatment of common questions that arise in pregnancy, which will help practitioners explain the condition to their patients. This important book will be of value to medical practitioners and other professionals dealing with toxoplasmosis.

A companion volume to the work *Ultrastructural Appearances of Tumours*, this is a guide to the diagnosis of a variety of non-neoplastic diseases encountered in diagnostic human ultrastructural pathology. It is intended for use by ultrastructural pathologists.

When we were first approached by the senior editors of this series to edit a book on interactions between the host and infectious agents, we accepted this offer as an exciting challenge. The only condition, readily agreed upon, was that such a book should focus on the immunology of infections in humans. Our reasons, if not biases, were severalfold. We sensed that the fields of microbiology and immunology, which had diverged as each was focusing on its individual search, were coming together. In agreement with the opinions expressed by Dr. Richard

Krause in the Introduction, we strongly believed that the development of the immune system evolved in response to infectious agents and that the evolution of these agents was influenced in turn by the character of the host's responses. An intensive examination of the multitude of primitive or more recently developed host defense mechanisms to determine their relative contribution to man's resistance to a given infectious agent appeared to us to be of crucial basic and practical interest. Many immune mechanisms studied in animals were being explored in humans and it appeared timely to focus particularly on what was known about man's resistance to infectious agents, correlating this information with lessons learned from relevant experiments in animal models.

Global Advances in Biogeography brings together the work of more than 30 scientific authorities on biogeography from around the world. The book focuses on spatial and temporal variation of biological assemblages in relation to landscape complexity and environmental change. Global Advances embraces four themes: biogeographic theory and tests of concepts, the regional biogeography of individual taxa, the biogeography of complex landscapes, and the deep-time evolutionary biogeography of macrotaxa. In addition, the book provides a trove of new information about unusual landscapes, the natural history of a wide array of poorly known plant and animal species, and global conservation issues. This book is well illustrated with numerous maps, graphics, and photographs, and contains much new basic biogeographical information that is not available elsewhere. It will serve as an invaluable reference for professionals and members of the public interested in global biogeography, evolution, taxonomy, and conservation.
