The difference between permanent magnet synchronous motor and brushless DC motor Generally, when the brushless DC motor is designed, the air gap magnetic field is square wave (trapezoidal wave) and the flat top portion is as flat as possible. Therefore, in the pole logarithm selection, an integer slot concentrated winding such as a 4-pole 12 slot is generally selected, and The magnetic steel is generally a concentric fan-shaped ring, which is radially magnetized.

Duane C. Hanselman. Written for electrical, electronics, and mechanical engineers responsible for designing and specifying motors, the book provides details of brushless DC and synchronous motors, as well as both radial and axial motor topologies. Beginning with a discussion of the fundamentals of generic motor design, it logically progresses to a set of more advanced, yet easily understandable, concepts for designing brushless permanent-magnet motors.

DC brushless ducted fan. The two coils on the printed circuit board interact with six round permanent magnets in the fan assembly. A brushless DC electric motor (BLDC motor or BL motor), also known as electronically commutated motor (ECM or EC motor) and synchronous DC motors, are synchronous motors powered by direct current (DC) electricity via an inverter or switching power supply which produces electricity in the form of alternating current (AC) to drive each phase of the motor via a ...

The vector control of an Interior Permanent Magnet (IPM) Brushless DC motor involves running both Simulink and MagNet transient solvers simultaneously. Co-simulations allow the strengths of two separate simulators to be combined, in this case the powerful system-level simulation of Simulink with the dynamic electrical machine analysis of MagNet.

A brushless exciter design for a hybrid permanent magnet generator applied to series hybrid electric vehicles. This presentation discusses the design of a brushless exciter for a hybrid permanent magnet (HPM) generator for application in series hybrid electric vehicles (SHEV). The brushless exciter has a 36-pole stator winding and multi-phase rotor configuration that supplies the HPM wound field (WF) rotor via a rotating rectifier.
