This volume compiles the complete texts of the environmental policies from some of the world's leading corporations. The policy statements form the backbone of the corporation's interaction with its employees, customers and regulatory agencies, and is often a required first step of participation with environmental business standards. Each entry includes brief contact and line-of-business information, as well as information about the corporation's participation with legislation and industry environmental standard.

The first step any company must take before it can begin ISO 14001 implementation is to secure 100 percent, enthusiastic commitment from top management. Top management is persuaded if ISO 14001 impacts the bottom line. This practical, how-to book helps you build a business case for ISO 14001. Implementing ISO 14001 brings a corporate culture change, resulting in cost savings, reduced waste, and enhanced relationships with community regulators and other stakeholders. The author explores these issues with top people in the field who have already implemented the system. She addresses: what steps did they take? has the business case been supported by experience? what are the tangible cost savings? Through these interviews you understand what elements or cost savings can be transferred to your company. You will learn how to convince senior management to implement ISO 14001 - and what business benefits your company will see through the eyes of experts who have been down that path. Once you have top management on board, you must deliver. *The Bottom Line: How to Build a Business Case for ISO 14001* shows you how to implement ISO 14001 and how it will profitably affect your bottom line.

Environmental and social performance measurement and reporting by business has become a high-profile issue during the 1990s. It is increasingly being requested by stakeholders and required by governments. Companies too are finding that they need better environmental and social performance data for effective internal management. And there are a growing number of standardisation initiatives – such as the ISO 14031 guidelines on environmental performance evaluation or the CERES Global Reporting Initiative (GRI) template for sustainability reporting – that are aimed at making it easier for more companies to take action, and for stakeholders to compare their progress. Sustainable Measures collects together most of the key work and individuals concerned with the topic from around the world. Contributions include: environmental and social reporting by John Elkington and colleagues at SustainAbility; the GRI discussion draft; Roger Adams and Martin Houldin on the FEE study of environmental reporting; Janet Ranganathan of the World Resources Institute on sustainability measures; and Martin Bennett and Peter James on ISO 14031 and the future of environmental performance evaluation. There are also chapters examining current practice in Austria, Denmark, India, Indonesia, Japan, the Netherlands and South Africa, developments in electronic reporting, as well as case studies of Baxter, Kunert, Niagara Mohawk, Unox, The Body Shop and the UK water industry, and an analysis of leading social reports. The book is essential reading for all academics, campaigners, policy-makers and practitioners with an interest in issues such

In their introduction, the editors of *New Ways of Doing Business* assert that in retrospect, it will be apparent that today's government, that of the early years of the 21st century, 'was undergoing its most significant transformation since the decade of the 1930's when direct government-delivered services grew significantly as part of the New Deal.' This newest volume in the IBM Endowment for the Business of Government series is an invaluable guide to navigating the sometimes controversial changes taking place in the internal operations of government, the delivery of services to citizens, and the delivery of environmental programs. Possibly the most monumental change taking place in our modern government is the lessening allegiance to the old model of in-house, in-departmental performance of tasks. The new model asks 'how and by whom can the tasks of government best be performed?' The answer sometimes lies with another inter-governmental department, leading to an in-house atmosphere of healthy competition and entrepreneurship, and sometimes with outside contractors. *New Ways of Doing Business* provides descriptions and guidelines for successfully navigating management under the new model. There are also dramatic new ways in which services to the public can now be

delivered: via the Internet, via contracts with private organizations, and via faith-based initiatives and business improvement districts. Experts provide valuable checklists and guidelines and case studies exploring the merits and disadvantages of these new service delivery routes. Finally, *New Ways of Doing Business* explores what the editors call one of the most highly experimental policy arenas in government, that of the delivery of environmental programs. The authors of these articles explain via case study analysis many of the innovative programs currently in existence, and postulate that the traditional 'command-and-control' stance of government to businesses will be superseded by a flexibility that will allow for increased 'eco-efficiency' and attention to market-based regulatory tools.

To date, both internal and external corporate environmental reporting and management systems have focused on physical input–output measures. However, external stakeholders are increasingly demanding that organisations provide more financial information about the costs and benefits of their environmental actions. As environmental costs rise, internal decision-makers are also seeking such information to ensure that money is well spent. Beyond basic compliance, many companies will not countenance environmental actions for which a "business case" cannot be made. A number of companies – such as Baxter, BT, Xerox, Zeneca and others – are now beginning to develop a better understanding of the costs and benefits of environmental action. The US Environmental Protection Agency has also done considerable work on models designed to understand the "full costs" of pollution control investments, with the aim of demonstrating that – when these are properly considered – pollution prevention can be a more cost-effective alternative. The *Green Bottom Line* brings together much of the world's

leading research and best-practice case studies on the topic. Divided into four sections, covering "General Concepts", "Empirical Studies", "Case Studies" and "Implementation", the book includes case studies from the US EPA's Environment Accounting Programme and contributions from authors at institutions including the IMD, INSEAD, Tellus Institute and the World Resources Institute. It constitutes a state-of-the-art collection.

In a world where corporate governance scandals have become the everyday, the role of business schools in producing the managers of today – and tomorrow – has come into sharp focus. Today's managers and the MBAs that will follow them are in need of an education that grounds business ethics and the overarching concerns of sustainable development into the curriculum. As some, but by no means all, organisations are coming to realise, bad performance in environmental protection, labour practices and human rights is no longer a "soft" issue but one that can hit the bottom line with a vengeance. So, what is the state of the art in teaching business sustainability worldwide, and what teaching practices and tools are achieving successful results? This book begins to answer these questions and more. There are many challenges facing educators in the field of sustainability. It is an evolving field still in its infancy as a management discipline; and there is also the need to combat the unstated but often underlying assumption that many environmental and social issues represent non-valued-added effort. Teaching Business Sustainability acknowledges this problem, while helping students explore the various ways in which the theoretical value of business sustainability can result in valuable and value-added practical outcomes. A wide mix of approaches is therefore indicated; while many of these are experimental and on the leading edge of management

learning, they all share an experiential (and often a team-based) element, and attempt to bring together the theory in a way that makes it relevant to practitioners in the field. The implication is that, whenever possible, educators need to link the learning to the students' immediate and pressing "real-world" realities. This applies equally to undergraduates or high-level executives. However, in the absence of immediate examples of such realities (as may often be the case in undergraduate settings) educators need to introduce experientially based approaches that recreate such settings in the classroom. The book also argues the case for holistic and interdisciplinary learning. It is clear from much of the literature on sustainability that the concept does not easily lend itself to being pigeonholed and that it crosses many of the functional areas of business. Indeed, it goes beyond just business learning to encompass many fields such as ecology, engineering and biology. If students are to move beyond the narrow perspective that conventional business studies often entail, they need to be introduced to the wider vision that an interdisciplinary approach engenders. The final point that emerges from this collection is that experiential learning of business sustainability often can, and should be, fun! Be it a heated exchange in a case-study discussion, a role-play exercise or a hands-on student consulting project, much experiential learning seems to excite the imagination of the students and to release their creative juices. The 23 contributions to Teaching Business Sustainability have been divided into three thematic groups. In the first section, 'Theory, Critique and Ideas', the authors explore and critique some of the overarching ideas and thinking behind the teaching of sustainability. The next section, 'Learning from Current Practice', contains the experiences of a number of educators and the successful and leading-edge approaches that they have used. The final section then outlines tools,

methods and approaches that can be used to teach business sustainability. This last section also serves as an introduction to a second volume – Teaching Business Sustainability Vol. 2 – which provides educators of sustainability with a series of case studies, role plays and experiential exercises. Teaching Business Sustainability is an invaluable resource both for educators working in a wide range of academic disciplines, looking for inspiration and guidance on how to teach business sustainability, as well as for organisations looking to reinvigorate internal management education programmes to factor in corporate responsibility and sustainability issues.
