CDMA is a form of spread-spectrum, a family of digital communication techniques that have been used in military applications for many years. The core principle of spread spectrum is the use of noise-like carrier waves, and, as the name implies, bandwidths much wider than that required for simple point-to-point communication at the same data rate.

1. CDMA (Code Division Multiple Access) is a direct-sequence spread spectrum (DSSS) based technique for multiplexing. 2.

Principle: – CDMA assigns a unique code sequence to each user which is used to code data before transmission. – If a receiver knows the code sequence related to a user, it is able to decode the received data.
